

Outbound Pilot — Kickoff Brief

Positioning, ICP, messaging, and success criteria for the EraseAI cold-outbound pilot with Aprile Dañez.

Purpose of this pilot

Validate the ICP, messaging, and deliverability for EraseAI in a single US-first segment — and generate qualified sales conversations. This is a learning engagement: success is a validated, repeatable outbound system plus early qualified meetings, not revenue in six weeks. The narrative is owned by EraseAI; execution is owned by Aprile.

1 TARGET ICP — FIRST SEGMENT

We deliberately start narrow. One segment lets us read signal fast before expanding to legal, financial, and healthcare later.

Industry: AI / ML SaaS Cybersecurity Data Infrastructure Platforms

Company size: 20–250 employees **Region:** United States only

Decision-makers: CISO CTO Head of AI / ML VP Engineering Founder DPO / Security Lead

Why this segment first: they build with AI daily, feel the "shadow AI" pain acutely, and have budget owners who already think in terms of data risk — the shortest path to a resonant message.

2 CORE POSITIONING

EraseAI is the AI Firewall — it stops sensitive data from leaving your organisation through AI tools, before it happens, not after.

Prevention, not forensics. Control at the prompt, not a report next week.

Three ideas the message must carry to technical buyers:

Govern the interaction, not the model. The risk is the moment an employee pastes source code, PII, or financial data into a prompt.

Visibility ≠ control. A dashboard of last week's leaks is forensics; enterprises want the incident to be structurally impossible.

Trust is defensibility. Buyers purchase what they can prove to a regulator, board, or customer — not benchmark scores.

3 MESSAGING ANGLES TO TEST

Run 3–4 angles across the sequence so we learn which pain converts. Each gets its own subject-line family and follow-up logic.

A · Shadow AI

"Your team is already pasting company data into ChatGPT."

Lead with the uncomfortable truth. Employees use public AI tools daily; source code, customer PII, and secrets leave the building unlogged. EraseAI catches and blocks it at the prompt.

B · Compliance Defensibility

"Prove to your auditor what data never left."

For CISOs / DPOs facing SOC 2, ISO 27001, or customer security reviews. Position EraseAI as audit-ready evidence that AI usage is controlled and logged.

C · Prevention vs. Forensics

"DLP tells you what leaked. We stop it before it does."

For teams that already have monitoring but no real-time control over the AI layer. Frame the gap between detection and prevention.

D · Dataset Governance / Unlearning

"Provably remove data from your trained models."

For teams training proprietary models — dataset sanitisation and verified machine unlearning. Narrower, but high-intent when it lands.

4 DRAFT SUCCESS CRITERIA

To finalise together at kickoff. Proposed targets for a 6-week, US-first pilot of ~500–900 verified prospects (email + LinkedIn, 3–5 touches):

Inbox deliverability

> 98%

bounce < 2%

Reply rate

4–8%

of contacted

Positive replies

1–2%

of contacted

Qualified meetings

3–6

booked, over the pilot

A "qualified meeting" =

(1) fits the ICP above, (2) attendee is a decision-maker or direct influencer, (3) has acknowledged a relevant pain or interest, and (4) attends the scheduled call. Lists or replies alone do not count.

5 NON-NEGOTIABLES

US-only for the pilot. No UK/CA/AU until consent rules (esp. CASL) are cleared — the brand cost of getting this wrong is too high.

Impeccable sending hygiene: clean SPF / DKIM / DMARC, clearly EraseAI-affiliated domains (not throwaways), instant opt-out. Our outreach must demonstrate the standard we sell.

EraseAI owns the narrative; Aprile owns list-building, deliverability, sequencing, and optimisation.

Hot replies escalate immediately. Any high-intent response from a CISO / CTO / DPO comes straight to Firdous for a personal, technical reply.
