

# EraseAI Investor Cheat Sheet

\$2.5M seed - Firdous Mahmood - director@vantward.com - Singapore

## ONE-LINER

Prompt-layer AI firewall: inspect, score, and act before Send. Browser + Android + API.

## VISION

Control plane for AI interactions. Govern use; don't ban ChatGPT. Wedge -> Team policy (\$99/mo) -> Enterprise audit (SSO/SIEM).

## PROBLEM

Secrets/PII pasted into ChatGPT, Claude, Gemini daily. Legacy DLP misses the prompt layer. Once sent = logged, retained, irreversible.

## TRACTION (be honest)

Pre-revenue - active pilots - Chrome extension + Android (Play internal) - Stripe + Play billing live.

## THE ASK

\$2.5M seed @ \$12M pre (~17% dilution), or SAFE \$12-15M cap. Lead \$1-1.5M + angels.

## USE OF FUNDS

40% eng (\$1.0M) Team console, detection, SSO hooks | 35% GTM (\$875K) pilot->paid | 15% ops/compliance (\$375K) | 10% reserve (\$250K). ~22 mo runway.

## 18-MO MILESTONES

Paying Team logos - \$500K-\$1M ARR (or 50+ Team accounts) - 3 Enterprise design partners.

## MARKET

AI cybersecurity ~\$94B by 2030 (24% CAGR, GVR). Beachhead: mid-size SaaS, agencies, tech teams.

## VS INCUMBENTS

Network DLP/CASB see traffic, not prompts. We're prompt-native, attachment-deep, multi-LLM, on-device.

## WHY ME (not 'solo')

Saw the leak -> built store-ready wedge (extension + Android + API + billing) without burning seed. 26 yrs ops leadership (BAF Squadron Leader, aviation CEO) + AI governance training. Round hires GTM + enterprise eng. Solo proved the layer; team converts pilots.

## HARD Qs

OpenAI builds this? Neutral cross-LLM layer buyers need. Defensibility? Policy graph + audit + on-device depth. Revenue? Pre-revenue; round = conversion.

## DEMO

Paste AWS key or customer record into ChatGPT with extension on. Show Sanitize / Block / Send Anyway.

## ENTERPRISE (WiFi / central server)

Endpoint inspects prompt (primary). Corp firewall blocks AI bypass (backstop). Policy server on THEIR servers. WiFi alone cannot read HTTPS chat.

## LIVE vs ENTERPRISE

Today: extension + Android + cloud. Enterprise: MDM push, on-prem policy, SSO/SIEM, egress rules.

## ENTERPRISE HOW TO (4 phases)

1 Policy server on customer infra 2 Endpoint via Chrome Enterprise/MDM 3 Network egress/DNS backstop 4 Pilot then roll out. Full guide in deliverables/.

## CLOSE

Stop the leak before Send. Sell the control plane after. Pause 2 beats -> Q&A.
