

EraseAI - 10-Slide Speaker Notes

Maps to 12-slide deck (slides 2+3 and 11+12 combined). Target: 8-10 min + demo + Q&A. Pace ~145 wpm.

Tip: Play landing video silently during slides 4-5, or run live demo after slide 4.

SLIDE 1 - ~45 sec

Title - AI firewall for the prompt layer

SAY:

I'm Firdous Mahmood, founder of EraseAI at Vantward Solutions in Singapore. We sit at the moment of Send - before data reaches ChatGPT, Claude, or Gemini. Browser extension, Android app, developer API. This is a two-point-five-million-dollar seed to turn a live wedge into Team revenue.

NOTES / TRANSITION:

Don't rush. Make eye contact. Deck slide 1/12. If they know cyber: lead with 'prompt layer DLP.' If generalist: lead with 'shadow AI leak.'

Problem + Why Now

SAY:

Every day, employees paste source code, customer records, and API keys into public AI tools. Shadow AI happens inside the browser - IT never sees the prompt. Legacy DLP was built for email attachments, not conversational AI. Once it's sent, it can be logged or used for training - disclosure is irreversible. Three forces make this urgent now: GenAI adoption, tightening regulation, and breach costs averaging nearly five million dollars.

NOTES / TRANSITION:

Deck slides 2-3. Cite Cyberhaven qualitatively if asked ('meaningful share confidential'). Don't fear-monger - stay factual.

Transition: 'That's the gap we close.'

SLIDE 3 - ~75 sec

Solution - Prompt-layer firewall

SAY:

EraseAI is a prompt-layer firewall. Browser extension intercepts prompts and attachments before Send. Android gives the same gate on mobile AI apps. We flag PII, secrets, credentials, and high-risk content on-device - then the user sanitizes, cancels, or sends with audit. Individual install is the wedge; Team policy and Enterprise audit are where we monetize.

NOTES / TRANSITION:

Deck slide 4. Emphasize: wedge = firewall. Dataset sanitizer and API are flanks, not the seed thesis. Offer live demo after slide 5 if room is engaged.

SLIDE 4 - ~60 sec

How It Works

SAY:

Flow is simple: intercept at Send, inspect text files and archives including OCR, classify risk, deliver a Safe, Caution, or Danger verdict, then act - rewrite, block, or allow with logging. All of this happens before the model sees the data. No network proxy required; works across ChatGPT, Claude, and Gemini from one control point.

NOTES / TRANSITION:

Deck slide 5. Walk through visually on slide - don't read bullet labels. Demo cue: 'I can show an AWS key block live in thirty seconds.'

SLIDE 5 - ~60 sec

Differentiation

SAY:

We're built for the layer legacy DLP misses. Prompt-native - at Send in browser and on Android, not only on the network. Attachment-deep - text, files, OCR, archives. Multi-LLM - one policy for shadow AI across vendors. Land-and-expand - user installs first; Team and Enterprise follow. We govern use; we don't only block ChatGPT.

NOTES / TRANSITION:

Deck slide 6. If they mention Purview or Zscaler: 'Great products - wrong layer. We're complementary until we prove Team ARR.'

SLIDE 6 - ~45 sec

Market

SAY:

Large market, sharp beachhead. AI in cybersecurity grows from twenty-five to ninety-four billion by 2030. Our beachhead is mid-size SaaS, agencies, and tech teams - high ChatGPT use, security waking up, no appetite to ban the tool. We sell the AI-prompt slice of a nine-billion-dollar DLP market.

NOTES / TRANSITION:

Deck slide 7. Do NOT say 'every company.' Beachhead first, then finance, legal, healthcare. Grand View Research on CAGR if challenged.

SLIDE 7 - ~60 sec

Business Model

SAY:

Land free, monetize Team, expand Enterprise. Seven-day trial at zero dollars for wedge adoption. Five-dollar Personal is acquisition. Ninety-nine-dollar Team - ten seats, shared policy, admin - is primary revenue. Enterprise is custom: SSO, audit, SIEM, VPC. Nineteen-dollar API for embed. Pricing is live on eraseai.ai with Stripe and Google Play.

NOTES / TRANSITION:

Deck slide 8. Highlight Team as the SKU this round optimizes. Personal is top-of-funnel, not the business.

SLIDE 8 - ~45 sec

Unit Economics + ROI

SAY:

Illustrative economics: one prevented breach - IBM averages four point eight eight million - funds years of Team seats at ninety-nine dollars a month. This is security budget, not consumer spend. Motion is land with Personal or API, expand to Team, upsell Enterprise. I'll say clearly: these are projections; we're pre-revenue today.

NOTES / TRANSITION:

Deck slide 9. Must verbalize 'illustrative, pre-revenue' - builds trust. Don't imply guaranteed ROI.

Traction + Why Me

SAY:

Traction: shipping the wedge, converting to seats. Live browser firewall, Android on Play internal testing, billing wired, active pilots - pre-revenue. Next twelve months: Team admin, shared policies, audit export, convert pilots to paid logos. Why me: I saw employees paste secrets into AI tools and built the product to prove the category - not a mockup, a store-ready system. Twenty-six years in operational leadership including Squadron Leader in the Bangladesh Air Force and CEO in aviation - security with real consequences. I'm studying AI governance because buyers will be legal and compliance, not just engineering. This round hires GTM and enterprise engineering because converting twenty pilots needs a team.

NOTES / TRANSITION:

Deck slide 10. Honest on pre-revenue. 'Why me' = problem ownership + shipped wedge + domain fit - NOT 'I work alone.' Acknowledge solo doesn't scale; say what funding fixes.

SLIDE 10 - ~75 sec

Enterprise deployment

SAY:

Enterprise WiFi cannot read encrypted prompts - we are endpoint-first. Layer one: extension on managed devices inspects at Send. Layer two: egress firewall blocks direct AI access unless governed - catches bypass on corp WiFi. Layer three: policy server on customer servers - rules, audit, SSO. Live today: extension, Android, cloud. Enterprise: MDM, on-prem policy, network rules, SIEM. Pilots start with browsers; seed builds console and design partners.

NOTES / TRANSITION:

Deck slide 11/13. Live vs Enterprise table on slide. Full HOW TO:
[deliverables/EraseAI_Enterprise_Deployment_Guide.md](#)

SLIDE 11 - ~60 sec

The Ask + Close

SAY:

We're raising two point five million dollars seed. Use of funds: Team and Enterprise console, detection hardening, GTM to convert pilots into paid seats. Milestones: paying Team logos, early ARR, Enterprise design partners with SSO and audit needs. We're at twelve million pre-money - roughly seventeen percent dilution - seeking a lead at one to one and a half million. EraseAI: stop the leak before Send. Sell the control plane after. I'd welcome your feedback and twenty minutes for a live demo. Thank you.

NOTES / TRANSITION:

Deck slides 11-12. Pause two beats before Q&A. Have cap table answer ready if asked. Send follow-up email within twenty-four hours with deck + video link.
